

WHY SUPPORT A VACCINE SAFETY COMMISSION?

- In the past decade, new science on the immune system has been staggering.
- Of most importance to vaccination, and vaccine injury—especially slowly-evolving chronic health issues such as learning, behavior, and developmental disorders, allergies, and other autoimmune disorders—is the science of the gut-brain connection.
- It is now known that 70% of the immune system is in the gut; and it is known that many neurological, developmental, and immune disorders have origins in gastrointestinal issues.
- New studies on aluminum adjuvant neurotoxicity, immune activation, and shared proteins between viral & bacterial pathogens and humans leading to autoimmune reactions are being ignored by the CDC.
- More than a dozen CDC scientists have come forward as whistleblowers, saying their work is being undermined and corrupted by outside forces.

The science on the safety and impact of vaccines cannot be declared “settled” in the face of so many scientific discoveries such as this:

“They’ll Have to Rewrite the Textbooks”

The University of Virginia announced in 2016 the discovery that the lymphatic system is directly connected to the brain. “It’s a stunning discovery that overturns decades of textbook teaching: researchers at the School of Medicine have determined that the brain is directly connected to the immune system by vessels previously thought not to exist.”

“But the true significance of the discovery lies in its ramifications for the study and treatment of neurological diseases ranging from autism to Alzheimer’s disease to multiple sclerosis.”

But because the 1986 NCVIA removed liability for injury or death due to pediatric vaccines, as Justices Sotomayor & Ginsberg said in 2011, we now have “a regulatory vacuum in which no one ensures that vaccine manufacturers adequately take account of scientific and technological advancements when designing or distributing their products.”

Worldwide, millions of parental reports of adverse reaction to vaccination are now being validated by new, peer-reviewed studies. Everything about vaccine design and administration should be reevaluated. The true scope and magnitude of adverse events are not known. The science is not settled.
